Implement Iris Flower Classification using KNN

CODE :

```
import numpy as np
X = np.array([
    [4.9, 3.0, 1.4, 0.2],
    [6.2, 3.4, 5.4, 2.3],
    [5.9, 3.0, 5.1, 1.8],
    [5.8, 2.7, 4.1, 1.0],
    [6.0, 2.7, 5.1, 1.6]
])
y = np.array(["Setosa", "Setosa", "Virginica",
              "Virginica", "Versicolor", "Versicolor"])
test = np.array([5.0, 3.4, 1.5, 0.2])
dist = np.sqrt(np.sum((X - test) ** 2, axis=1))
k = 3
nearest = np.argsort(dist)[:k]
# Majority class
classes, counts = np.unique(y[nearest], return_counts=True)
prediction = classes[np.argmax(counts)]
print("Predicted Flower:", prediction)
```

OUTPUT

```
Predicted Flower: Setosa
```

```
=== Code Execution Successful ===
```
