Implement the Car Price Prediction Model using Python

CODE :

```
import numpy as
npX = np.array([
    [2, 20],
    [3, 30],
    [4, 40],
    [5, 50]
])
y = np.array([900, 800, 700, 600, 500])
X = np.c_[np.ones(len(X)), X]
w = np.linalg.pinv(X) @ y
# New car: age=2, mileage=25
new_car = np.array([1, 2, 25])
# Prediction
price = new_car @ w
print("Predicted Car Price:", round(price, 2))
```

OUTPUT

```
Predicted Car Price: 750.5
```

```
=== Code Execution Successful ===
```
